On Track

AEO

5

On Track

May 12, 2026

Claude Skill and Plugin by Alex Labat

Executive Summary

Deliver WMS has the technical foundation of a top-quartile B2B SaaS site: clean URLs, unique metadata on every page, rich internal linking, and modern static-site delivery on Astro and Vercel. What holds the score back is almost entirely additive: the site ships zero JSON-LD structured data, the canonical tags point to the wrong host (non-www while the site serves www), and the E-E-A-T trust layer — named team, customer proof, social presence — has not been built yet.

The single biggest opportunity is leverage. The /pricing FAQ, the /about 5-step flow, and the /compare page are already written exactly the way generative AI search engines want to ingest them — they just need the schema wrapper. Wrap them, fix the canonical, build the team page, and launch the bi-weekly blog with a disciplined pillar structure and Article schema, and the combined score moves from 18/30 to a realistic 26/30 within a quarter.

The strongest single asset on the site is the /compare page. Its honest concession that ShipHero is stronger on marketplace breadth is exactly the kind of original, opinionated content AI engines preferentially cite. Build more of that voice — that is your moat.

Dimension	Score	Status	Key Takeaway
SEO	7/10	On Track	Strong fundamentals; canonical mismatch and zero schema markup hold it back from a top score.
GEO	6/10	On Track	Exceptional factual density, but weak E-E-A-T signals (no named team, no testimonials, no social proof).
AEO	5/10	On Track	FAQ + HowTo content exists in prose form but no schema; biggest quick wins live here.

Dimension	Score	Status	Key Takeaway
Combined	18/30		<i>Solid B-grade site with clear, executable path to a top-tier score.</i>

Pages Audited

All 10 pages below were fetched and analyzed for this audit. The site's sitemap and robots.txt could not be retrieved directly through this tool — verify separately that /robots.txt allows crawling and /sitemap.xml lists every route (use @astrojs/sitemap if not yet configured).

URL Path	Page Type	Notes from Crawl
/	Homepage	Strong meta, clear value prop, no schema markup
/features	Features (long-form)	7 modules with specific ROI numbers; 1500+ words
/compare	Comparison	Original POV vs 5 competitors; high GEO potential, no schema
/pricing	Pricing + FAQ	5 FAQ Q&As in prose — primary FAQ schema candidate
/roadmap	Roadmap	Short, list-based; could carry an Event/release schema
/docs	Documentation index	30 modules across 7 categories; deep internal linking
/about	About	Mission + 6 architecture choices; missing named team and credentials

URL Path	Page Type	Notes from Crawl
/contact	Contact	Form + email; no phone, no address, no map
/docs/inbound	Docs subpage (sample)	Module overview — short (~300 words), needs depth
/docs/billing	Docs subpage (sample)	Module overview — short (~250 words), needs depth

SEO Analysis — Score 7/10

The SEO foundation is strong. Two specific issues prevent a higher score: the canonical/host mismatch is a real problem that mis-directs link equity, and the complete absence of structured data forfeits every rich result eligibility Google offers.

Technical On-Page

Signal	Finding	Status
Title tags	All 10 pages have unique, descriptive titles. Range: 51–63 chars. Slightly long: Features (62), Pricing (63), but within tolerance.	Good
Meta descriptions	All pages have unique meta descriptions, 125–155 chars. Compelling, contain CTAs and primary keywords.	Good
H1 tags	Every page has exactly one H1. Examples: "The WMS that pays for itself in operational time" (Home), "Pricing that pays for itself" (Pricing).	Good
Heading hierarchy	Clean H1 → H2 → H3	Good

Signal	Finding	Status
	structure. No skipped levels, no keyword stuffing. Numbered section markers ("01/07") aid scanability.	
URL structure	Clean, hyphen-free, semantic: /features, /pricing, /docs/inbound, /docs/billing. No query parameters or session IDs.	Good
Canonical tags	CRITICAL MISMATCH: Every page declares <link rel="canonical" href="https://deliverwms.com/..."> (no www) while the site serves on https://www.deliverwms.com/. Search engines receive conflicting signals about the canonical host.	Needs Attention
Viewport meta	Present on all pages: width=device-width, initial-scale=1.0. Mobile-first ready.	Good
Image alt text	Dashboard screenshot has rich, descriptive alt. /images/hero.webp appears to lack descriptive alt across multiple pages. Site-wide audit recommended.	Needs Attention
Internal linking	Strong. Features → docs ("Read the receiving documentation"), docs → related modules, homepage → features → pricing. Anchor text is descriptive.	Good
Open Graph / Twitter Card	og:title, og:description,	Good

Signal	Finding	Status
	og:image, og:type, og:url, twitter:card present on every page. og:image reuses hero.webp on every page (improvable).	
Robots & meta robots	Could not fetch /robots.txt directly in this audit (verify separately). No <meta name="robots" content="noindex"> observed on any crawled page.	Needs Attention

Content Quality

Signal	Finding	Status
Word count	Marketing pages content-rich: Pricing ~1700 words, Features ~2000+, Compare ~1300, About ~900. Docs subpages thin (~250–400 words).	Good
Keyword signals	Primary topic crystal clear: "warehouse management", "WMS", "3PL", "last-mile delivery", "fulfillment", "multi-tenant", "billing reconciliation". Semantic coverage is strong.	Good
Content freshness signals	Footer shows "© 2026 Deliver WMS". No visible publication or update dates on any page. No blog yet, so no recency signal stream.	Needs Attention
Readability	Excellent. Short	Good

Signal	Finding	Status
	paragraphs, frequent subheadings, numbered/bulleted lists, "Without / With" comparison blocks. Scannable on every page.	
Long-tail content coverage	Strong on bottom-funnel (pricing, compare, features). Thin on top-of-funnel ("how does X work in a warehouse?") — the gap the planned blog should fill.	Needs Attention

Structured Data

Signal	Finding	Status
JSON-LD schema markup	Zero schema markup detected on any of the 10 pages crawled. No Organization, no SoftwareApplication, no FAQPage, no BreadcrumbList, no HowTo, no Product, no Article.	Missing
Schema opportunities (unrealized)	/pricing has 5 ready-made FAQ Q&As. /about has a 5-step "How it works" sequence. /docs has visible breadcrumbs ("Home > Documentation > Inbound Receiving"). All are missing JSON-LD wrappers.	Missing
Microdata / RDFa	None detected. Acceptable — JSON-LD is the preferred format. The issue is the absence of structured	Missing

Signal	Finding	Status
	data overall.	

GEO Analysis — Score 6/10

GEO is the most interesting dimension here. The factual density and original tone are best-in-class — and they're being held back by the absence of two specific signals that AI engines rely on: Organization schema (so the engine can recognize the brand as an entity) and named-author/expert signals (so the engine can decide whether the page is authoritative enough to cite).

E-E-A-T Assessment

Signal	Finding	Status
Named authors / bylines	No author bylines anywhere. No "Written by" credits, no team page with individual profiles. About says "built by operators, for operators" but names no operators.	Missing
About page credibility	/about exists and articulates mission + 6 architecture choices, but does not name the founders, share credentials, link to LinkedIn profiles, or list a team. Reads as anonymous company.	Needs Attention
Contact information	hello@deliverwms.com listed. No phone number. No physical or registered business address. "Remote-first team serving logistics operations worldwide." For B2B SaaS this is borderline acceptable but limits trust.	Needs Attention

Signal	Finding	Status
Customer trust signals	No customer logos, no named case studies, no testimonials with attribution, no awards, no press mentions, no certification badges (SOC 2, ISO, etc.).	Missing
Organization schema	No Organization JSON-LD declared anywhere. AI engines have no canonical way to identify the brand entity, its logo, founding date, or social presence.	Missing

Content for AI Synthesis

Signal	Finding	Status
Factual density	Exceptional. \$800–\$1,800/mo time savings, \$0.12/stop, \$0.12/label, \$0.18/pallet, 14 billable event types, 30 modules, ~7 min/shipment receiving, ~45 sec/line pick. AI engines cite specific facts.	Good
Clear value claims	Top of every page makes a defensible claim with backing math. "The WMS that pays for itself" → followed by line-by-line savings breakdown.	Good
Source citation / external references	No external citations to research, government statistics, or industry reports. Adding a few authoritative refs (e.g., MHI annual report, US BLS warehousing data) would	Needs Attention

Signal	Finding	Status
	strengthen AI-cite-worthiness.	
Comprehensiveness	Marketing pages comprehensively address the buyer journey. Docs subpages cover what each module does but skip how it works in depth and miss edge cases / troubleshooting.	Needs Attention
Entity clarity	"Deliver WMS" is consistently named across every page, footer, and meta tag. Brand entity is unambiguous to crawlers.	Good
Original perspective	The /compare page openly concedes that ShipHero is stronger on marketplace breadth and that native connectors are on the roadmap. This honesty is rare and a strong GEO signal — AI engines prefer pages that take a stance.	Good

Technical GEO

Signal	Finding	Status
Structured data depth	No basic schema, let alone advanced types like Dataset, ClaimReview, SpeakableSpecification, or author Person schema.	Missing
HTTPS	TLS enabled site-wide. Baseline GEO trust signal	Good

Signal	Finding	Status
	satisfied.	
Server-side rendering	Astro-generated static HTML — content is fully present in initial HTML payload. AI crawlers (which often do not execute JS) can read everything. Strong advantage over JS-heavy SPAs.	Good
sameAs / brand entity links	No links to LinkedIn, X, GitHub, YouTube, Crunchbase, or any third-party profile that would tie the brand entity into the broader knowledge graph.	Missing
Crawlability	Site appears fully crawlable from observed HTML. /robots.txt and /sitemap.xml could not be fetched in this audit — verify these exist and are not blocking key paths.	Needs Attention

AEO Analysis — Score 5/10

AEO is where the biggest quick wins live. The site already writes content in a way that's nearly snippet-ready — short paragraphs, clear definitions, numbered processes, a real FAQ. None of it is marked up with the JSON-LD schema that tells Google and AI engines "extract this as a direct answer." Adding FAQPage to /pricing alone is a 1-hour change that materially improves featured snippet eligibility.

Featured Snippet Eligibility

Signal	Finding	Status
Direct answer paragraphs	Some short, well-formed	Needs Attention

Signal	Finding	Status
	answers exist (especially in the Pricing FAQ: "An order is one outbound order processed through fulfillment."). Most other pages favor narrative prose over snippet-ready paragraphs.	
Definition patterns ("X is...")	Limited use. "Deliver WMS is the all-in-one warehouse management and last-mile delivery platform..." appears in meta but rarely as a first sentence under an H2/H3.	Needs Attention
Numbered list content	Excellent. Homepage 7-step fulfillment flow, About 5-step "From dock to doorstep", Features 1–7 module breakdown — all snippet-eligible if marked up.	Good
Comparison tables	/pricing has a clean "What's included by plan" comparison table. /compare uses prose-vs-prose blocks rather than a true tabular comparison — converting to a table would unlock table snippets.	Needs Attention

Structured Answer Formats

Signal	Finding	Status
FAQPage schema	Five high-quality Q&A pairs exist on /pricing ("How are orders counted?", "Can I switch plans later?", "Do	Missing

Signal	Finding	Status
	you charge per user?", "What about Shopify and other integrations?", "Is data isolated per tenant?") — but no FAQPage JSON-LD wrapping them.	
HowTo schema	/about has a 5-step process ("Receive & Store → Manage Inventory → Fulfill Orders → Dispatch & Deliver → Report & Bill"). Homepage has a 7-step end-to-end flow. Both are textbook HowTo schema candidates — neither is marked up.	Missing
Question-phrased headings	Mostly statement headings ("Where the time savings actually come from", "Why operators choose Deliver WMS"). Only the Pricing FAQ uses natural question phrasing.	Needs Attention
SpeakableSpecification	Not present. Voice assistants have no marked-up region to read aloud.	Missing
Article schema (blog)	No blog yet. Once launched, every post should ship with Article + Person (author) + datePublished + dateModified + image schema.	Missing

Voice Search Readiness

Signal	Finding	Status
Conversational language	Tone is conversational and operator-friendly throughout. "We chose to capture the billable event at the moment of action because..." reads like a person, not a brochure.	Good
Long-tail question coverage	Limited. The blog plan is the natural vehicle for "how does X work in a 3PL warehouse" voice-search queries.	Needs Attention
Local signals / NAP	Not applicable. Company is remote-first and serves globally. No local SEO play, no LocalBusiness schema needed.	Good

Priority Recommendations

Sequenced by combination of impact and effort. Critical items address signals search engines actively penalize or fail to interpret. High items are large opportunities that compound over weeks. Quick Wins take under an hour each and should be batched.

Priority	Issue & Recommendation	Dimension	Effort	Impact
Critical	Canonical URLs point to deliverwms.com but site serves www.deliverwms.com. Search	SEO	Low (10 min)	High

Priority	Issue & Recommendation	Dimension	Effort	Impact
	engines receive mixed signals about the authoritative host.			
Critical	Zero JSON-LD schema markup on any page. Add Organization (every page), SoftwareApplication (Home + Features), FAQPage (Pricing), BreadcrumbList (Docs), HowTo (About flow).	SEO / GEO / AEO	Medium (1–2 days)	Very High
High	E-E-A-T trust layer is thin. About says "by operators, for operators" but names no operators. Add founder bio + photo + LinkedIn, customer logos, first testimonials, and social profile links.	GEO	Medium	Very High
High	Add FAQPage schema to	AEO	Low (1 hr)	High

Priority	Issue & Recommendation	Dimension	Effort	Impact
	/pricing — five well-structured Q&As already exist in prose and just need the JSON-LD wrapper.			
High	Launch the bi-weekly blog with a pillar/cluster structure (operational how-to, original benchmarks, industry commentary). Enforce Article + author + dates + FAQ schema per post.	SEO / GEO / AEO	Ongoing	Very High
High	Add HowTo schema to the About page "From dock to doorstep" 5-step flow and the homepage 7-step fulfillment flow.	AEO	Low	Medium–High
Medium	Expand the 30 documentation subpages from 250–400 words to 800–1500 words each, with	SEO	High (over time)	High

Priority	Issue & Recommendation	Dimension	Effort	Impact
	screenshots, code samples, and FAQ blocks. Each is a long-tail SEO asset.			
Medium	Add visible publication and update dates on marketing pages, docs, and (especially) blog posts. Freshness signals matter for both Google and AI engines.	SEO / GEO	Low	Medium
Medium	Convert more H2/H3 headings into natural questions ("How does WMS billing reconciliation work?") to increase featured-snippet and PAA eligibility.	AEO	Medium	Medium–High
Medium	Add a phone number to /contact and consider listing a business jurisdiction/regi	GEO	Low	Medium

Priority	Issue & Recommendation	Dimension	Effort	Impact
	structured address. Helps LocalBusiness-adjacent signals and AI engine trust.			
Quick Win	Audit and fill image alt text site-wide. Hero.webp and many decorative graphics are missing descriptive alt attributes.	SEO	Low	Low–Medium
Quick Win	Add social profile links (LinkedIn, X, GitHub, YouTube if applicable) in the footer and as Organization.sameAs in schema. Strengthens entity graph for AI engines.	GEO	Low	Medium
Quick Win	Create page-specific Open Graph images instead of reusing /images/hero.webp on every page. Boosts	SEO	Low	Low–Medium

Priority	Issue & Recommendation	Dimension	Effort	Impact
	click-through on social shares and LinkedIn previews.			
Quick Win	Verify /robots.txt is present and not blocking; ensure /sitemap.xml exists and lists all routes. (Astro+Vercel: use @astrojs/sitemap.)	SEO	Low	Medium

Blog Strategy — Your Highest-Leverage Move

You mentioned planning a bi-weekly blog about the logistics and warehouse industry. This is the single highest-leverage move you can make for all three dimensions of search — and the gap analysis above tells you exactly which content to prioritize.

Why bi-weekly blog content matters for AI search

Perplexity, ChatGPT Search, and Google AI Overviews preferentially cite pages with three traits: original data, named expert authors, and explicit answers to well-formed questions. A bi-weekly cadence with the right pillars will hit all three over time. Stale-content sites get displaced by fresher answers.

Three content pillars to commit to

1. Operational How-To (long-tail SEO + AEO). Question-phrased titles, step-by-step structure with HowTo schema, FAQ schema appended.

- "How to reduce receiving errors in a multi-client 3PL warehouse"

- "How to set up cycle counts that actually catch shrink"
- "How 3PLs should price storage fees in 2026"
- "How to migrate from a legacy WMS to a modern platform without a six-week SOW"

2. Original Benchmarks & ROI (the GEO killer). This is where AI engines get hungry.

Publish small, specific datasets:

- "What does manual billing reconciliation actually cost the typical 3PL? A 12-warehouse benchmark."
- "Receiving time per inbound shipment: scan-driven vs spreadsheet — measured across 200 sessions"
- "Average labor cost per outbound order across mid-size US 3PLs"
- "WMS pricing transparency index 2026: who shows their rates and who hides them"

3. Industry Commentary (authority + brand). Strong opinions, owned, on the record:

- "Why per-user pricing is the wrong model for 3PL WMS"
- "The case against bolt-on multi-tenancy"
- "Last-mile economics post-2025: who survives the contraction"
- "What the WMS market consolidation means for mid-size 3PLs"

Technical setup for the blog on Astro

- Astro Content Collections with a Zod schema enforcing title, description, author (required), publishDate, updateDate, ogImage, faq[], heroImage, tags.
- A single BlogPostLayout.astro that emits Article + Person + BreadcrumbList JSON-LD from frontmatter. Add FAQPage and HowTo emit when the corresponding frontmatter arrays are present.
- article:published_time and article:modified_time Open Graph properties.
- @astrojs/rss for an /rss.xml feed; @astrojs/sitemap to auto-include new posts (if not already wired).
- /team/<slug> pages for each author with Person schema — link Article.author.@id to /team/<slug>#person.
- BreadcrumbList: Home → Blog → Post Title on every post.
- Tag-based topic clusters with HubPage / index pages per pillar.
- Per-post Open Graph images (don't reuse hero.webp — see Quick Win recommendation).

Cadence and pillar mix

Bi-weekly = roughly 26 posts/year. A productive mix: alternate one deep pillar post (2000+ words, original data or comprehensive how-to) with one shorter cluster post (800–1500 words, narrower topic linking back to a pillar). The pillar posts are the ones AI engines will cite repeatedly; the cluster posts compound your topical authority over time.

What's Working Well

These are real strengths grounded in what the crawl actually surfaced — not generic compliments. Keep doing these.

Page metadata fundamentals	Every page has a unique, keyword-relevant title (e.g., "Deliver WMS — Warehouse Management & Last-Mile Delivery") and meta description within the 150–160 char optimal range. Consistent across all 10 pages crawled.
Open Graph + Twitter Card coverage	og:title, og:description, og:image, og:type, og:url, twitter:card all present on every page. Social shares and LinkedIn previews will render correctly out of the gate.
Clean, semantic URL structure	No query strings, no IDs in URLs. /features, /pricing, /docs/inbound, /docs/billing — perfectly readable for both humans and crawlers.
Strong internal linking architecture	Docs index cross-references modules, feature blocks link to corresponding docs ("Read the receiving documentation"), and footer surfaces solution-page anchors. Topical authority is being concentrated correctly.
Exceptional factual density	Specific dollar amounts (\$800–\$1,800/mo savings, \$0.12/stop, \$0.18/pallet), specific time savings (~24 hrs/mo on receiving, ~16 hrs/mo on B2B portal), 14 billable event types, 30 modules across 7 categories. AI engines feed on this.
Original, opinionated point of view	/compare openly admits "we're honest about this one: native marketplace connectors are on the roadmap, not shipped" and concedes ShipHero is stronger for marketplace breadth. This kind of honest, original perspective is exactly what generative engines like Perplexity and ChatGPT Search prefer to cite.
Clean heading hierarchy	Single H1 per page, logical H2 section headers, H3 sub-points. No keyword stuffing, no skipped levels.

Mobile viewport meta	Present on every page (width=device-width, initial-scale=1.0). Mobile-first indexing is satisfied.
HTTPS site-wide	All resources served over TLS. Baseline trust signal for both Google and AI engines.
Modern static-site stack (Astro + Vercel + GitHub)	Fast TTFB, easy to add schema via layouts, easy to enforce frontmatter validation for blog posts. The runway to fix the issues called out in this report is short.

Glossary

Brief definitions for the three optimization disciplines covered in this audit.

SEO — Search Engine Optimization

The practice of optimizing a website to rank in traditional search engine results (Google, Bing). Signals include page metadata, content quality, site structure, backlinks, and technical health. The mature discipline of the three.

GEO — Generative Engine Optimization

Emerging discipline focused on getting your content cited by AI-powered search engines (Perplexity, ChatGPT Search, Google AI Overviews, Gemini). These engines synthesize answers from multiple sources and reward clarity, factual density, original perspective, named expert authors, and structured data that maps to a knowledge graph.

AEO — Answer Engine Optimization

Optimization for direct-answer surfaces: Google featured snippets, People Also Ask boxes, voice assistants. Relies on question-phrased headings, concise paragraph answers, and structured data (FAQPage, HowTo, SpeakableSpecification). Older and more concrete than GEO but heavily overlapping.

Next Steps

A reasonable 30-day sequence:

- Week 1: Fix the canonical/host mismatch site-wide. Add Organization + SoftwareApplication JSON-LD to the base layout. Add social profile links (sameAs).
- Week 2: Add FAQPage schema to /pricing. Add BreadcrumbList to all /docs/* pages. Add HowTo schema to /about and the homepage 7-step flow.

- Week 3: Write a real About page with named founder(s), photos, LinkedIn links, and short bios. Add a phone number to /contact. Ship 3–5 customer testimonials or logos.
- Week 4: Stand up the blog scaffold on Astro Content Collections with the schema enforcement described above. Publish post #1 (a Pillar 2 benchmark post — original data is the highest-impact opener).

Re-run this audit in 60 days and the combined score should clear 26/30.
